1 Description

The PSI-MOS-DNET CAN/FO... modular fiber optic transmission system enables the transmission of CAN-based bus systems such as DeviceNet or CANopen via fiber optics.

The main advantage of this system is the electrically isolated connection of bus devices, which prevents the negative effects of voltage equalization currents and electromagnetic interference on the bus cables. In addition, bus cable short circuits only affect the specific potential segment. This increases the overall availability of the system, and improves flexibility in terms of the design of the bus topology in a linear, star or tree structure.

Up to 20 fiber optic modules can be connected side by side to form optical star couplers, which are tailored to the specific application. Cross-wiring within a modular star coupler is created automatically via the backplane.

Depending on the required transmission distance, modules for polymer/HCS fiber or glass fiber cables can be combined. Polymer and HCS fiber cables can be assembled locally using fast connection connectors. The system supports transmission speeds from 10 kbps to 800 kbps. Depending on the set transmission speed, distances up to 100 m can be covered using polymer fiber,

up to 2800 m using HCS fiber, and up to 48 mode glass fiber.

Please note that the specified distances and performance of the optical interface of the converter in association with the type of optical fiber. Please take into consideration the restrictions on expansion due to the signal runtimes of the system structure (see page 11).

The devices are also equipped with comprehensive diagnostic functions to increase system availability and simplify startup. This means that faulty segments can be disconnected selectively.

The integrated fiber optic diagnostics permit monitoring of the optical transmission quality. A drop in transmission quality is indicated by an integrated early warning function. In the event of a transmission error, the system automatically switches to a redundant path.

The PSI-MOS system can be used in a supply voltage range from 10 V DC to 58 V DC and in a temperature range from -20°C to +60°C.

NOTE: Installation, operation, and maintenance may only be carried out by qualified specialist personnel.

When installing and operating the device, the applicable safety directives (including national safety directives), accident prevention regulations, as well as general technical regulations, must be observed.

NOTE: The device must not be opened or modified apart from the configuration of the DIP switches.

NOTE: The switches that can be accessed may only be actuated when the power supply to the device is disconnected.

Do not repair the device yourself, replace it with an equivalent device. Repairs may only be carried out by the manufacturer.

NOTE: The IP20 degree of protection (IEC 60529/EN 60529) of the device is intended for use in a clean and dry environment. The device must not be subject to mechanical strain and/or thermal loads, which exceed the limits described.

For the safety data, please refer to the operating instructions and certificates (EC-type examination certificate, other approvals, if necessary).

Observe the specified conditions for use in explosive areas.

WARNING: Explosion hazard
 Install the device in suitable housing with **IP20 protection, minimum**, that meets the requirements of EN 60079-15.
 Observe the requirements of EN 60079-15.

WARNING: Explosion hazard
 Disconnect the block power supply before connecting or disconnecting the device.
 – Snapping it on or disconnecting it
 – Connecting or disconnecting it

WARNING: Explosion hazard
 Only devices which are designed for use in zone 2 potentially explosive areas may be installed in zone 2. The device location may be connected to the signal circuits in zone 2.

WARNING: Explosion hazard
 The device must be stopped and removed from the Ex area if it is subject to an impermissible load or if it malfunctions.

Installation in areas with a danger of dust explosion

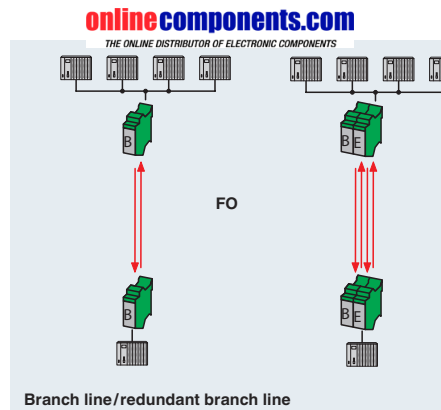

WARNING: Explosion hazard
 The device is **not** designed for installation in areas with a danger of dust explosion. If dust is present, install the device in approved housing.

below.

5.1 Branch/point-to-point connections

Two PSI-MOS...BM fiber optic basic modules can be used to easily convert a data link from copper cable to fiber optics. A PSI-MOS...BM basic module is used at the beginning and end of the line.

To increase system availability, the fiber optic line can also be designed redundantly. In this case, PSI-MOS...EM extension modules are connected either side of the basic modules and redundancy mode is configured.

5.2 Linear structures

PSI-MOS...BM basic modules are used at the beginning and end of the fiber optic line.

Combinations of basic modules and extension modules are used along the line as fiber optic repeaters. Depending on the transmission speed, up to 60 fiber optic paths can be cascaded (see "Configuration rules" on page 11).

5.3 Star structures

Modular fiber optic star couplers can be created by combining a basic module with up to 19 extension modules. A basic module should always be used at the end of a star line.

This structure again offers the option of combining basic modules and extension modules to form redundant circuits on critical lines in order to increase system availability.

Modules with different transmission technologies (660 nm or 850 nm) can be freely combined within a star coupler topology. However, devices with the same transmission technology should always be used at the beginning and end of a fiber optic connection (PSI-MOS...660... or PSI-MOS...850...).

Please also refer to the configuration notes (see page 11) for the maximum network expansion.

of up to 60 fiber optic segments can be achieved.

Please also refer to the configuration notes (page 11) for the maximum network expansion.

6 Function elements

Figure 3 Function elements

- 1 24 V DC supply voltage connection
- 2 0 V DC supply voltage connection
- 3 Switch contact, connection 11 (basic module only)
- 4 Switch contact, connection 12 (basic module only)
- 5 CAN connection: SHD (basic module only)
- 6 CAN connection: GND (basic module only)
- 7 CAN connection: C_H (basic module only)
- 8 CAN connection: C_L (basic module only)
- 9 "VCC" LED
- 10 "ACT" LED
- 11 "RD" LED
- 12 "FO SIGNAL" LED (3 LEDs)
- 13 "FO ERR" LED
- 14 Fiber optic transmitter
- 15 Fiber optic receiver
- 16 Backplane

Diagnostic and status indicators

Des.	Color	Meaning
VCC	Green	Ready to operate
	Flashing green (1 Hz)	Ready to operate mode in standby
	OFF	No supply voltage
ACT	Yellow	CAN bus active
	OFF	CAN bus not active
ERR	Red	CAN bus error (communication error)
FO SIGNAL	Green	Receiving power at the fiber optic port
	Green	
	Yellow	
FO ERR	Red	Optical path error

The quality of the path is determined using optical power P_{opt} and displayed using the LED bar graph.

LED bar graph	Receive status	Optical power
Green Green Yellow	Very good	P_{opt} is considerably above the system reserve
Green Yellow	Good	P_{opt} is still good for the system
Yellow	Critical	P_{opt} has reached the system reserve
Red	Error	P_{opt} has surpassed the system reserve/budget

In the event of a supply voltage failure, a communication error, a low receive level ("FO SIGNAL" = yellow) or an optical path error ("FO ERR" = red), the floating output of the LED bar graph also opens (see "Wiring the switch contact").

The device contains components that can be damaged or destroyed by electrostatic discharge. When handling the device, observe the necessary safety precautions against electrostatic discharge (ESD) according to EN 61340-5-1 and EN 61340-5-2.

- For configuration, release the housing cover using a screwdriver (A in Figure 4).
- Then carefully pull the PCB out of the housing as far as possible (B).

Figure 4 Opening the housing

The DIP switches can then be freely accessed.

- Configure the DIP switches according to the planned application.

Figure 5 Setting the DIP switches

7.2 Activating the termination resistor

If the PSI-MOS...BM basic module is used on a copper segment, the integrated termination resistor is activated.

- Set slide switch S5 to the "ON" position.

7.3 Activating the redundancy function

A PSI-MOS...BM basic module can be connected to a PSI-MOS...EM extension module to create a redundant optic connection.

- Place a basic module/extension module at both the beginning and end of the redundant line.
- On all the devices in a redundancy line, set slide switch S5 to "ON" to activate redundancy mode (default).

7.4 Setting the transmission speed

The transmission speed is set using DIP switches (default: 500 kbps).

NOTE: Set all fiber optic converters and connected bus devices to the same transmission speed.

Transmission speed (kbps)	DIP switches	
	2	3
10	OFF	OFF
20	OFF	ON
50	OFF	ON
125	ON	OFF
250	ON	ON
500	ON	ON
800	OFF	ON

use shielded two-wire cables for transmission.

The bus devices are passively connected to the main bus cable, which must be terminated at the ends using termination resistors.

Due to the CSMA/CA bus access method, the total network expansion is limited by the data rate used. This restriction also applies when the network is implemented with fiber optics.

Data rate	Maximum network expansion (copper)		Maximum FO cascading (paths)
	DeviceNet	CANopen	
10 kbps	–	5000 m ¹	60
20 kbps	–	2500 m ¹	30
50 kbps	–	1000 m	12
125 kbps	500 m	500 m	6
250 kbps	250 m	250 m	3
500 kbps	100 m	100 m	1
800 kbps	–	50 m	1

¹ Only when using repeaters, otherwise copper ≤ 1000 m

At the lowest data rate, the maximum expansion for a copper segment without repeater is 1000 m.

In addition to the general conditions, which depend on the data rate (see Section 8.2), the following parameters should always be considered:

- A maximum of 64 CAN devices can be operated per copper segment.
- The maximum length of a fiber optic path from converter to converter is:
 - Polymer fiber: 100 m, maximum
 - HCS fiber: 800 m (660 nm) or 2800 m (850 nm), maximum
 - Glass fiber: 4800 m, maximum

8.2 Configuring networks using PSI-MOS-DNET CAN/FO ...

When configuring a network using PSI-MOS-... modules, the signal delay caused by the fiber optic modules must be taken into account.

This signal delay reduces the maximum transmission distance by 48 m per fiber optic segment used.

When configuring your CAN installation, proceed as follows:

In some cases, several signal paths connect to the bus. In this case, the signal paths should be considered for each point.

- Determine the total length of all copper segments $L_{\text{Cable, total}}$ and the number of fiber optic segments n_{FO} in this line. Note the maximum cascading of fiber optic segments depending on the data rate.
- Calculate the effective total length $L_{\text{eff, total}}$ of the line. Add 48 m per planned fiber optic segment to the total length $L_{\text{Cable, total}}$. (This delay is caused by signal runtime in fiber optic converters.)

$$L_{\text{eff, total}} = L_{\text{Cable, total}} + n_{\text{FO}} \times 48 \text{ m}$$
- Finally, compare this calculated effective total length $L_{\text{eff, total}}$ with the maximum network expansion for the selected data rate. If the effective total length is less than the maximum expansion, the CSMA/CA mechanism works properly.

8.3 Configuration example

Figure 6 Configuration example

CANopen, 125 kbps

$$L_{\text{eff, total}} = \underbrace{20 \text{ m}}_{\text{Cu}} + \underbrace{130 \text{ m}}_{\text{FO}} + 3 \times 48 \text{ m}$$

A maximum network expansion of 500 m is selected for the selected data rate of 125 kbps. This configuration is valid because $L_{\text{eff, total}} < 500 \text{ m}$.

WARNING: PSI-MOS-... devices are designed for SELV operation according to IEC 60950/EN 60950/VDE 0805.

- Install the device on a 35 mm DIN rail according to DIN EN 60715.
To avoid contact resistance only use clean, corrosion-free DIN rails.
- End clamps can be mounted on both sides of the device to stop the devices from slipping on the DIN rail (for ordering data see page 3).

WARNING: Connect the DIN rail to protective earth ground using a grounding terminal block. The devices are grounded when they are snapped onto the DIN rail (installation according to PELV).

This ensures that the shielding is effective. Connect protective earth ground with low impedance.

9.1 Assembly as an individual device in the control cabinet (stand-alone)

- Place the device onto the DIN rail from above. The upper holding keyway of the device must be hooked onto the top edge of the DIN rail (see Figure 7).
- Push the device from the front towards the mounting surface.
- Once the device has been snapped on properly, check that it is fixed securely on the DIN rail.

Figure 7 Assembly in the control cabinet

- sides of both modules lie flush with one another.
- No **onlinecomponents.com** together as described above.

9.2 Assembly in potentially explosive areas

WARNING: Observe the safety rules for potentially explosive areas.

- Areas with a danger of gas explosions
The devices are suitable for use in zones 0 and 1. Devices installed in zone 1 can be connected to a fiber optic interface. The fiber optic interface must be a certified item of equipment with protection type Ex ib I. Do not connect to a fiber optic interface with protection type Ex ib II.
- Areas with a danger of dust explosions
The devices are not designed for installation in areas with a danger of dust explosions. If dust is present, install the device in a suitable enclosure housing. When installed outside areas with a danger of dust explosions, devices installed in zone 2 must be connected to the fiber optic interface.

9.3 Removal

- To remove a PSI-MOS... unit, the PSI-MOS... unit on the right-hand side must be pushed out of the rail. The entire male connector/female connector must be released.
- Pull the locking latch down using a screwdriver or nose pliers or similar.
- Pull the bottom edge of the module away from the mounting surface.
- Pull the module diagonally upwards away from the rail.
- If removing a complete star distributor, pull the star distributor rail connectors from the DIN rail as well.

Figure 8 Individual/redundant supply

Operation as an individual device

Supply the supply voltage to the module via terminal blocks 1 (24 V) and 2 (0 V).

Operation in a star coupler topology

When the devices are operated in a star coupler topology, the supply voltage must only be supplied to the first device in the station. The remaining devices are supplied via the backplane. A redundant supply concept can be created by connecting a second power supply unit to another device in the topology.

Figure 9 Connecting the data cables

NOTE: Use CAN-compatible bus. Connect the cable shielding at both ends of the transmission path.

- Connect the CAN cable to the COMBI of the basic module.

Contact	Function
1	+24 V
2	+ 0 V
3	Switch contact connection
4	Switch contact connection
5	CAN_Shield
6	CAN_GND
7	CAN_High
8	CAN_Low

In a star coupler topology, the CAN data is automatically forwarded to adjacent devices via the backplane.

- For optimum shield connection, use the connection clamp.

modules connected to the right of the basic module as group messages via the backplane (Figure 10).

The switch contact on the basic module opens if one of the following occurs on the basic module itself or on a connected extension module:

- The supply voltage fails
- The optical threshold on the fiber optic path is not reached
- The fiber optic path is interrupted

If several basic modules are used in a star coupler topology, a new group message segment begins at each basic module. This means that when redundant structures are used, each redundant line can be monitored separately for errors via its basic module.

To create a single group message for an entire topology, the switching outputs (N/O contacts) should be connected externally in series.

NOTE: The maximum load capacity of the relay contact is 60 V DC/42 V AC, 1 A.

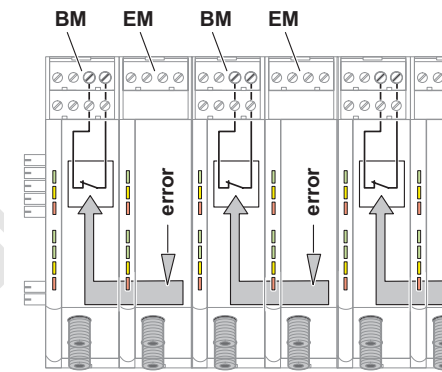

Figure 10 Early warning contact

the glass fibers.
The infrared light is not visible.

NOTE: Dust protection caps should only be removed just before the connectors are connected. They prevent contamination of the transmit and receive elements.
The same applies for the protective caps on the connectors.

NOTE: The following fiber optic lengths must not be exceeded:

PSI-MOS-DNET CAN/FO 660 ...

- 100 m with F-P 980/1000; 230 dB/km
- 800 m with F-K 200/230; 10 dB/km

PSI-MOS-DNET CAN/FO 850 ...

- 2800 m with F-K 200/230; 8 dB/km
- 4200 m with F-G 50/125; 2.5 dB/km
- 4800 m with F-G 62.5/125; 3.0 dB/km

NOTE: When using fiber optics, observe the fiber optic installation guidelines, DB GB IBS SYS FOC ASSEMBLY (Order No. 9393909).

F-SMA connection (PSI-MOS-DNET CAN/FO 660 ...)

PSI-MOS-DNET CAN/FO 660 ... devices use F-SMA connectors for the fiber optic connection. F-SMA is a standardized fiber optic connection.

Figure 11 F-SMA connection

- The connectors are secured on the device by manually tightening the screw collar (see 2 in Figure 11).

Figure 12 B-FOC connection

- Connect the fiber optic cable to the B-connector for the transmit and receive push the connector clamp mechanism
- Secure the connection with a quarter t (see 2 in Figure 12).

Measuring and connecting devices

Due to the integrated optical diagnostics, the measure the path.

NOTE: Note the fiber optic cable when coupling two PSI-MOS dev

Device 1 fiber connection "TD" (t device 2 fiber connection "RD" (r (Figure 13).

NOTE: Due to different operating PSI-MOS-DNET CAN/FO 660 ... PSI-MOS-DNET CAN/FO 850 de not be connected directly with on fiber optic cables.

Figure 13 Crossed cables
